

The body might be slow, but the brain does not age as fast, so dogs still need mental stimulation

New neural pathways are made all the time. Brain cells are constantly being destroyed and produced

Senior dogs love new places - it is good for their brains

Lack of stimulation in old age can cause depression and stress

A curious dog is a happy dog

We need to give seniors a helping paw to adapt to changes such as :-

- Loose muscle
- Aches and pains
- Get tired - sleep more
- Difficulty bending
- Lie Down more
- Harder getting in/out, up/down
- Incontinence
- Hearing
- Eyesight
- Eating habits
- Cognition / memory

HAPPY HEALTHY DOG

SENIOR DOGS

HELP THEM TO ADAPT

A curious dog may live longer
Keep the curiosity intact - it helps
the brain to be active

WAYS TO HELP YOUR SENIOR DOG

OLD AGE

May start around 8/9 years or before for larger dogs. 12-15 years for smaller breeds

Chronic stress can age a dog producing more physical and mental problems

HEARING

Use visual signs as they age, makes it easier later on. Dogs may become more fearful if they cannot hear

They may get colder and move closer to the fire - give them more warmth

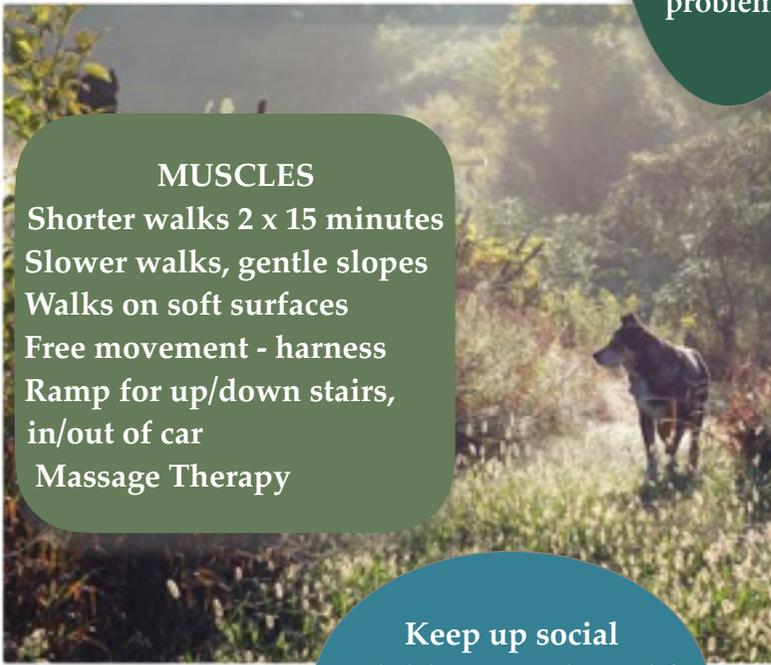

EYESIGHT

Dogs compensate well when their eyesight goes, it can often go undetected. Other senses are often heightened. Train your dog the command "watch it" if an obstacle is in the way. Slap your hand on your leg as you walk for them to follow. Dogs may become more fearful if they cannot see

MUSCLES

- Shorter walks 2 x 15 minutes
- Slower walks, gentle slopes
- Walks on soft surfaces
- Free movement - harness
- Ramp for up/down stairs, in/out of car
- Massage Therapy

Keep up social activities - meeting with friends to avoid depression

EATING

Feed smaller and more often if they prefer it. Use a raised feeding bowl - muscle in neck and back can become painful. Good nutrition is vital to keep support the body's functions. They may need supplements to support the joints and body
